

ESSnuSB accumulator ring parameter list			
Last updated by Maja Olvegård, 2019-09-13			
Parameter	Unit	Value	Comment
<b>Beam parameters, incoming</b>			
Kinetic energy	GeV	2.5	
Momentum	GeV/c	3.308	
Relativistic Lorentz factor	-	3.664	
Relativistic speed	c	0.962	
Magnetic rigidity	Tm	11.03	
Transverse emittance, rms normalized	$\pi$ mm mrad	0.35	
Energy spread			
Average macro-pulse current (protons for neutrons)	mA	50	No injection or extraction gaps in this pulse.
Macro-pulse duration (protons for neutrons)	$\mu$ s	2860	Maximum possible macro-pulse duration is ~2900 $\mu$ s
Bunch frequency	MHz	352.2	RF frequency in linac is 352.2 MHz (up to spoke section) and 704.4 MHz (elliptical section).
Number of particles per macropulse	#	8.93E+14	
Number of batches	#	4	Each linac macro-pulse is split into 4 batches. Each batch is accumulated separately.
Number of particles per batch	#	2.23E+14	This is the batch intensity for all pulsing schemes.
Chopping factor			
<b>Accumulator ring</b>			
Circumference	m	384	more precise: 384.0134 m
Arc length	m	40	
Length of straight sections	m	56	
Revolution time	$\mu$ s	1.331	
Extraction gap duration, at the time of injection	$\mu$ s	0.133	Gap for ramping the extraction kickers, generated in the linac. Duration corresponds to 10% of revolution time.
<b>Pulsing scheme A, BASELINE</b>			
Linac pulsing frequency	Hz	28	
Batch frequency	Hz	1351.35	
Micro-bunch frequency	MHz	352.20	
Micro-bunch intensity	#	1.10E+9	
Injection gap duration	$\mu$ s	100	This is the gap between the batches/fills.
Batch duration	$\mu$ s	640	
H-beam current in linac	mA	62.07	Nominal linac current increased to compensate for 10% injection gaps and ~10% extraction gap.
Number of injected turns	#	481	
Number of particles per injected turn	#	4.64E+11	
Beam current at extraction	A	29.83	

Pulsing scheme B			
Linac pulsing frequency	Hz	70	
Batch frequency	Hz	70	
Micro-bunch frequency	MHz	352.2	
Micro-bunch intensity	#	8.86E+8	
Batch duration	μs	794.4	10% for extraction gap added to pulse duration
H- "compensated" beam current, linac	mA	50	
Number of injected turns	#	597	
Number of particles per injected turn	#	3.74E+11	
Beam current at extraction	A	29.83	
Pulsing scheme C			
Linac pulsing frequency	Hz	70	
Batch frequency	Hz	70	
Micro-bunch frequency	MHz	352.2	
Micro-bunch intensity	#	7.04E+8	
Batch duration	μs	1000.0	1331 μs corresponds to a 1000 injected turns
H- "compensated" beam current, linac	mA	39.72	ca 30 mA for a 1000 injected turns
Number of injected turns	#	751	1000 injected turns for a batch duration of 1331 μs
Number of particles per injected turn	#	2.97E+11	
Beam current at extraction	A	29.83	
Accumulator lattice and optical parameters			
General			
Transition gamma	-	5.825	
Chromaticity, horizontal	-	-11.2	
Chromaticity, vertical	-	-12.4	
Range of chromaticity correction, horizontal	-		
Range of chromaticity correction, vertical	-		
Tune, horizontal	-	8.2-8.3	
Tune, vertical	-	8.3-8.4	
Tune, longitudinal	-		
Momentum compaction factor, alpha	-	0.02947	
Phase slip factor, eta	-	-0.0450	
Acceptance of primary collimator	π mm mrad	120	Preliminary
Acceptance of secondary collimator	π mm mrad		
Ring acceptance	π mm mrad	400	Preliminary
Dipole aperture			
Bunching factor		>0.9	

Space charge tune shift		-0.028	Gaussian beam
<b>Arc lattice</b>			
Number of FODO cells per arc	#	4	
phase advance per FODO cell, horizontal	$\pi$	0.25	
phase advance per FODO cell, vertical	$\pi$	0.267	
Bending radius of arc dipole	m	8.48	
Magnetic field strength in arc dipole	T	1.301	
Number of dipoles per arc	#	8	
Number of quadrupoles per arc	#	8	
Number of sextupoles per arc	#	5	Work in progress!
<b>Twiss, ring</b>			
Maximum horizontal beta	m	28.7	
Minimum horizontal beta	m	2.85	
Average horizontal beta, $\langle \beta_x \rangle$	m	10.8	
Maximum vertical beta	m	35.1	
Minimum vertical beta	m	2.74	
Average vertical beta, $\langle \beta_y \rangle$	m	11.4	
Maximum horizontal dispersion	m	4.879	
<b>Twiss, arc</b>			
Maximum horizontal beta	m	15.9	
Minimum horizontal beta	m	3	
Average horizontal beta, $\langle \beta_x \rangle$	m	8.37	
Maximum vertical beta	m	16.3	
Minimum vertical beta	m	2.74	
Average vertical beta, $\langle \beta_y \rangle$	m	8.16	
Maximum horizontal dispersion	m	4.879	
<b>Twiss, injection</b>			
Maximum horizontal beta	m	28.7	
Minimum horizontal beta	m	2.86	
Average horizontal beta, $\langle \beta_x \rangle$	m	12.5	
Maximum vertical beta	m	35	
Minimum vertical beta	m	2.86	
Average vertical beta, $\langle \beta_y \rangle$	m	13.6	
Maximum horizontal dispersion	m	1.60E-05	
<b>At the center of injection</b>			

Horizontal beta	m	10	
Horizontal alpha	-	0.0479	
Horizontal dispersion	m	-0.1028	
Vertical beta	m	20	
Vertical alpha	-	0.0239	
x'	rad	0	
y'	rad	0	
<b>RF</b>			
<b>Dual-harmonic</b>			
Voltage, harmonic 1	kV	5	
Voltage, harmonic 2	kV	2.5	
Bucket height	MeV		
Bucket area			
<b>Barrier bucket</b>			
Voltage	kV	10	
Signal shape		sinusoidal	
Barrier RF phase	degrees	160	The RF wave extends from 160 to 180 degrees and from -180 to -160 degrees.
<b>Beam parameters at extraction</b>			
Transverse beam emittance (100%)	$\pi$ mm mrad	120	
Normalized beam emittance (100%)	$\pi$ mm mrad	423	
Transverse distribution shape	-		
Extraction gap duration	$\mu$ s	0.1	We assume a 0.133 $\mu$ s incoming extraction gap from the linac. At the time of extraction this must be >0.1 $\mu$ s.
Pulse duration	$\mu$ s	1.23	
Maximum energy spread	%	$\pm 0.2$
